U.S. Travel Forecast

Spring 2026

FORECAST HIGHLIGHTS

Travel growth to continue despite near-term challenges

Weaker consumer spending to slow 2026 growth

Economic activity strengthened ahead of the U.S./Israel-Iran war, supported by a surge in tax refunds and a manufacturing turnaround. Since the conflict began, gasoline prices have risen sharply, pushing inflation above 3%. Higher prices are expected to weigh on real incomes and discretionary spending through 2026.

After a pullback in 2025, international travel will be a tailwind in 2026

After a considerable decline in 2025 due to negative international sentiment, inbound international visits are expected to return to growth in 2026 as tensions thaw, with the World Cup providing additional support to the international leisure market.

Domestic travel growth to remain steady in 2026, with healthy prospects through 2030

Despite a slowing economy and rising inflation, domestic travel continues to prove resilient. Higher-income households continue to drive growth, prioritizing experiences over goods. Business travel prospects are also solid, supported by strong corporate margins and near-term investment incentives under the OBBBA.

SPEND BY VERTICALS

— (2026 Forecast)

\$1.37T total in 2026

Domestic leisure (\$909B) drives the majority of travel spending

Domestic business accounts for 21% of spend (\$287B), split between transient (\$169B) and group (\$118B).

Spending from international visitors, including business, will account for 13% of total spend (\$178B) in 2026.

DOMESTIC TRIPS

Domestic travel to weather higher oil price environment

Despite a slower growing economy and higher inflation, domestic travel is expected to continue growing in 2026. With prices rising and real incomes under pressure, consumers are likely to shift spending toward more affordable options, particularly day trips and road travel.

Business travel growth is expected to lead the segment over the forecast horizon, following a marked deceleration in 2025 (1.2% versus 5.5% in 2024) as policy uncertainty weighed on corporate travel demand. Full recovery to pre-pandemic trip volumes is anticipated in 2028, supported by easing uncertainty and OBBBA investment incentives.

Business and leisure trips

Year-over-year growth

Business and leisure trips

Index (2019=100)

DOMESTIC SPENDING

Spending growth supported by prices as real growth slows

The domestic leisure segment will lead gains in 2026, as higher-income households continue to drive growth in a bifurcated consumer environment. The leisure segment will be further supported by the World Cup and the United States Semiquincentennial.

Despite strong headline growth, nominal gains in 2026 are expected to be significantly price-driven amid elevated inflation. Real domestic spending is expected to rise just 0.9%, as higher prices erode real household income growth.

Nominal business and leisure expenditures

Year-over-year growth

Real business and leisure expenditures (2025 dollars)

Year-over-year growth

INBOUND ARRIVALS

U.S. inbound arrivals recovery on pace for 2029

Inbound international visits are on track for a moderate rebound in 2026, supported in part by a thawing in negative international sentiment compared to 2025. Growth will be led by rebounding Canadian arrivals, while the Middle East will see a marked decline due to the disruption in the region.

International visits are projected to return to 2019 levels by 2029, supported by major global events including the 2026 World Cup and 2028 Olympics. However, policy measures perceived as restrictive or global fuel shortages could moderate the pace of recovery.

Year-over-year growth

Domestic and international trips

Index (2019=100)

INTERNATIONAL INBOUND SPENDING

Nominal inbound spend rebounds in 2026, but real recovery extends beyond the forecast horizon

Inbound international travel spending is expected to rebound 6.1% in nominal terms in 2026, with gains led by the leisure segment. On a real basis, however, the rebound moderates to 1.6%, reflecting the contribution of price effects to the headline growth figure.

In nominal terms, inbound international spending is forecast to surpass 2019 levels in 2026, led by leisure. On an inflation-adjusted basis, however, real international spending is expected to remain approximately 18% below 2019 levels in 2026, with full real recovery falling outside the current forecast horizon. This indicates that the apparent nominal recovery may be driven primarily by price effects rather than a genuine restoration of inbound demand.

Domestic vs international travel spending

Real, year-over-year growth (2025 dollars)

Domestic and international expenditures

Index (2019=100), in 2025 dollars

INFLATION ADJUSTED TRAVEL SPENDING

TRAVEL PRICE INDEX

Travel price pressures continue to ease

Travel prices are forecast to rise 4.4% in 2026, driven primarily by a surge in gas prices. Following this spike, travel prices are expected to remain essentially flat in 2027 (+0.2%) as gas prices retreat, with gains then averaging 1.9% annually from 2028 to 2030. This compares with an average annual forecast of 2.1% overall inflation over the same period.

Travel price index

Year-over-year % change

INFLATION-ADJUSTED SPENDING

Real business and leisure spending (in 2025 dollars)

While nominal leisure spending exceeded 2019 levels in 2022, real leisure spending only returned to pre-pandemic levels in 2025.

Inflation-adjusted business travel spending indicates a slower recovery than nominal estimates imply, with full recovery to 2019 levels not achieved within the forecast horizon.

Inflation-adjusted business and leisure expenditures
(including domestic and international)

Index (2019=100), in 2025 dollars

INFLATION-ADJUSTED SPENDING

Real domestic and international spending (in 2025 dollars)

Nominal international spending is forecast to reach 2019 levels in 2026, but real (inflation-adjusted) spending is not forecast to reach nearly pre-pandemic levels until 2030.

Inflation-adjusted domestic spending is only expected to recover in 2026, despite nominal domestic spending reaching 2019 levels in 2022.

Inflation-adjusted domestic and international expenditures

Index (2019=100), in 2025 dollars

FORECAST REVISIONS

DOMESTIC TRIPS

Revisions to forecasts

Slightly weaker-than-expected travel demand growth over 2025 and 2026 has resulted in a modest downgrade to the near-term forecast, although long-term prospects remain unchanged from our previous outlook.

Domestic trips

Index (2019=100)

INTERNATIONAL TRIPS

Revisions to forecasts

Following last year’s steep decline in arrivals, our outlook for the inbound rebound is broadly unchanged from the prior forecast, with a full recovery to 2019 levels still expected in 2029.

International trips

Index (2019=100)

TRAVEL TRENDS

KEY DRIVERS

Economic Output

The U.S. economy is facing new headwinds from an energy price shock linked to Middle East conflict, with inflation rising above 3% as gasoline prices surge. Activity was supported by tax refunds and a manufacturing turnaround at the start of this year, but these effects are fading as higher energy costs begin to weigh on growth.

Consumers

Consumer spending is becoming increasingly uneven, with higher-income households doing most of the heavy lifting while lower- and middle-income households face pressure from higher prices. Elevated costs and softer wealth effects are expected to slow consumer spending growth.

Inflation

The near-term course of inflation is sensitive to oil prices, but headline inflation will likely continue to rise in the coming months. Second-round effects on food prices and core inflation could keep the headline rate above 3% through the end of 2026.

International

Inbound international visits are expected to rebound moderately from 2025's decline, as tailwinds from major international events are weighed upon by the lingering impacts of policies perceived as unwelcoming. The arrivals recovery is highly dependent upon the pace at which geopolitical tensions cool.

MIDDLE EAST CONFLICT BRINGS SLOWER GROWTH

Tourism Economics lowered its 2026 GDP growth forecast for the U.S. by 0.9 percentage points to 1.9%, reflecting the energy price shock from the Middle East conflict and its expected drag on consumer spending.

Growth is expected to pick up in 2027 as the disruption related to the U.S./Israel war with Iran is expected to prove short-lived. The economy is forecast to expand by 2.4% per year on average over the coming decade, supported primarily by productivity gains.

Prior to the conflict in Iran, U.S. real GDP was expected to grow 2.8% in 2026.

U.S. Real GDP

Annualized growth rate

HEADWINDS AND RISKS

Domestic Leisure

- An increase in spending by low- and middle-income households on essentials rather than on discretionary purchases
- Jobless expansion contributing to soft labor market conditions
- Higher inflation from oil price surge weighing on real income growth and consumer spending, particularly discretionary spending

Domestic Business

- Elevated policy uncertainty from the Iran war and ongoing tariff volatility following the Supreme Court ruling
- Low consumer confidence and price pressures could drive weaker demand, weighing on profits

International

- Negative sentiment toward the current administration's rhetoric and trade policies against trade partners, particularly from Canada and parts of Western Europe
- Geopolitical conflict could exacerbate challenges for international inbound travel

FORECAST BACKGROUND & METHODOLOGY

The forecast has been prepared by Tourism Economics, an Oxford Economics company, who has been working with the U.S. Travel Association to forecast United States domestic and international inbound travel since 2008.

The forecast model incorporates both demand-side developments as well as exogenous supply-side factors, and has three sets of inputs: industry performance data, visitor metrics, and economic drivers. Monthly or quarterly industry performance indicators include hotel performance metrics (STR), scheduled air seat capacity (OAG), airport enplanements (BTS), and rural arterial vehicle miles (BTS). Tourism Economics evaluates multiple economic drivers to determine their relative strength in predicting changes in travel demand, such as disposable personal income, the unemployment rate, employment, exchange rates, corporate profits and investment, real GDP growth, and consumer confidence.

The travel forecast utilizes these relationships as well as the latest Oxford Economics forecast and predictive travel indicators, such as hotel bookings pace from TravelClick, group event bookings pace from Simpleview, and travel sentiment data from Longwoods International and Destination Analysts
